Summary

Tech Lead Manager with 5 years of experience designing and developing scalable web applications and backend systems. Responsible for driving technical direction, architectural decisions, product roadmap, and mentoring team members. Proficient across all areas of full-stack development, with an emphasis on composing robust microservices. Passionate about platform-driven architecture, cross-group collaborations, observability/tooling, and leveraging AI responsibly to deliver data-driven business value.

Experience

Apr 2025 - Present

Tech Lead Manager, Yext — Core Platform

- Managed a team of five engineers across multiple critical, core platform services such as Messaging (emails, notifications, webhooks), Goals, Geocoding, and Workflows.
- Led an organization wide effort to centralize and surface agentic events across arbitrary domains, architecting clear platform-domain boundaries and providing adoption guidance for integration.
- Designed and deployed a self-hosted, OSM-backed geocoding service which handles 60M requests/month, reducing external API spend by \$1.5M annually.
- Built a high performing team through coaching and career development, onboarding 2 new engineers and promoting 3 engineers.

Nov 2024 - Apr 2025

Senior Software Engineer (Tech Lead), Yext — Workflows

- Designed a new Rules engine to asynchronously evaluate event-driven conditions in the platform and orchestrate generic actions across services.
- Led multiple cross-team collaborations to integrate Social, Reviews, and Pages products into our governance flow. Increased adoption of our task management system by 5x and task engagement by 10x.

Aug 2023 - Nov 2024

Software Engineer 3, Yext — API

- Task force of three aimed at empowering API-first development at Yext. Standardized API development and resource-oriented design across Yext engineering.
- Propagated principal JWT tokens across all codepaths to delegate authentication and access control responsibilities to downstream services.
- Implemented an API adapter, built on top of github.com/grpc-ecosystem/grpc-gateway, that exposes internal RPC endpoints as RESTful APIs.
- Implemented a web adapter, built on top of github.com/grpc/grpc-web, to replace front-end interfaces built on the Play framework. Streamlined development at Yext by allowing front-ends to issue gRPC calls directly to the server.
- Provided an onboarding process to scaffold the proxy service programmatically to make it trivial to set up and deploy as a sidecar to a given resource service.

Aug 2020 - Aug 2023

Software Engineer 1 and 2, Yext — Notifications

- Built an integration with SendGrid to enable email whitelabeling for Yext emails. Rolled out a new HIPAA-compliant email sending provider to retain our at-risk healthcare customers (\$1.5M ACV).
- Implemented a new data model for notification profiles. Scaled our platform to send 5.5M notifications per month. Supported updates to notification configs declaratively via JSON and imperatively via API.
- Migrated API usage reporting from Prometheus-backed data sources to Snowflake. Migrated the data store backing developer API logs from Elasticsearch to Snowflake. Set up pipelines across all of our team services to ingest events, metrics, and logs into Snowflake.
- Designed SLIs and SLOs to track email sending and deliverability performance.

Education

2016 - 2020

Cornell University

- B.S. in Computer Science, minor in Business
- Organizations: Poseidon Dragon Boat Team (representing NewYork-Presbyterian), Cornell Badminton, Teaching Assistant for CS4700 (Introduction to Artificial Intelligence)

Skills

- Code: Java, TypeScript (React.js), Python, Go, MySQL
- Technologies: Apache Airflow, Kafka, Redis, RabbitMQ, gRPC, Play, Helidon, Bazel, Snowflake
- Monitoring: Grafana LGTM, Prometheus, Lightstep, Sentry
